# DELTA Recipe Setup System

Allows faster changeover from one part to the next by easily retrieving all Delta control setup parameters from a saved set of

Network or Direct Connection

Notebook PC

Network or Direct Connection

Desktop PC

Network Connection

Server

Delta Counter or Weigher Touch Screen Control Panel

Note: PC's or Server NOT supplied by Delta.

How It Works:

For a previously saved part number -

Using the Delta Touch Screen Control Panel, the machine operator goes to RECIPES then follows the instructions to enter the part number and retreive the setup data for that part.

For a new part number -

The machine operator sets up this new part and verifies it is running properly.
Then, the operator goes to RECIPES on the Control Panel and follows the instructions to save this part for future use.

Note:The operator may use a saved part number of a similar part to get close to the final setup then simply change the few settings that need to be changed to make this new part number run properly before saving the new part setup.

> **In all cases, the machine operator maintains control over the setup and may, at any time, improve upon the machine performance, then save these improved settings for future use.**

Required Products (Supplied by Delta):

Rockwell Automation RSSQL bundled with Microsoft SQL Server 2000
Rockwell Automation RSLINX OEM Communications Software
Custom programming for proper interface with your Delta System Components

Minimum PC or Server Requirements (Not supplied by Delta):

Windows XP Professional, 1MB Ram, P4 Processor, 36Mhz

Quality Delta Systems Since 1951
